1. Take off the cover

2. Take of the backend...don´t forget to loosen the fan connector
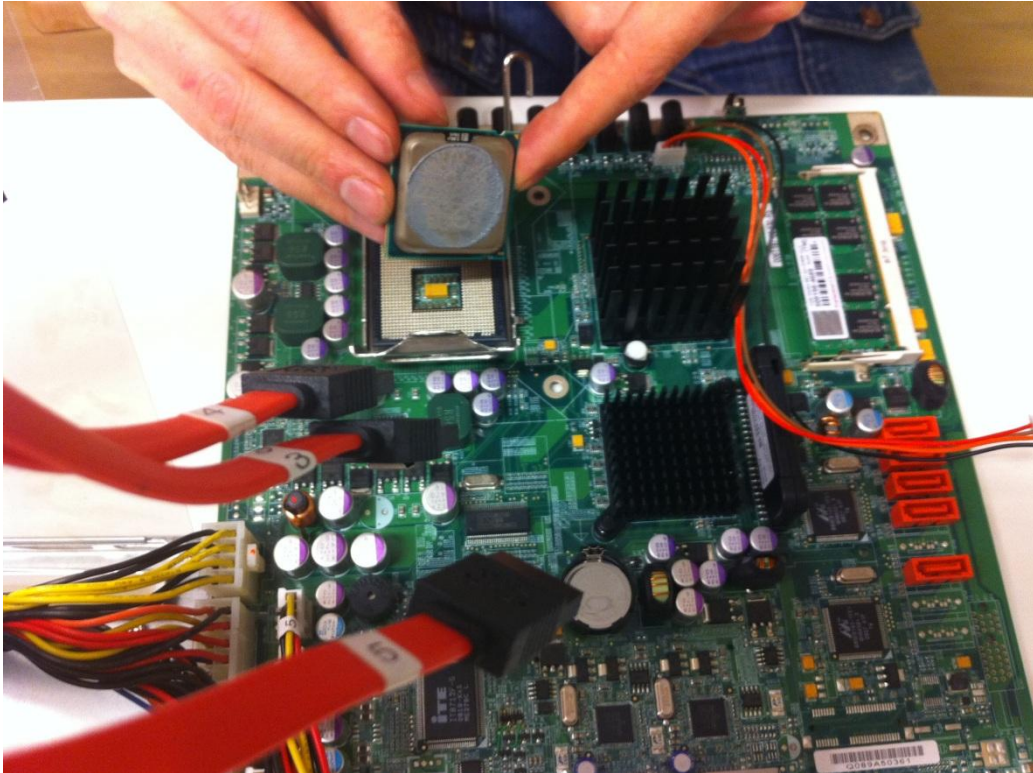

3. Disconnect the SATA connector on the motherboard end

4. With the Sata cables disconnected you can easily lay down the motherboard on the table

5. Remoce the CPU and really good looking heatsink

6. Put the new CPU in place and fasten the new intel stock heatsink, be careful not to bend the motherboard….and wash your hands before you touch the back of the motherboard or wear gloves

This is the CPU i replaced the stock Celeron with, even the stock fan fittet nicely. I bought the CPU för 70 US-dollar….definitly worth it.

Tha fan is driven by the motherboards CPU-fan connector. The second chassi FAN connector operates the 180mm fan in the back

The original heatsink is a real pice of art ☺

There is more than enough space for the stock fan.
